

EARPIECE FOR AUDITORY TESTING

ABSTRACT OF THE DISCLOSURE

An earpiece for auditory testing. In one form of the invention, an earpiece for  
5 auditory testing is provided which comprises a first baffle having a first side, a second side  
and a cover attached to the baffle first side and forming a first chamber. Further, an aperture  
may be located at one end of the first baffle so that the aperture communicates with the first  
chamber. Also provided may be a second baffle having a first portion, a second portion and  
10 an aperture located at one end of the second baffle and wherein the second baffle is located  
within the first chamber so that the second baffle aperture is positioned proximate the first  
baffle aperture and so that at least part of the second baffle first portion is attached to the  
cover and forms a second chamber. A transducer may be attached to at least a part of the first  
baffle second side and a conductive adhesive coating may cover at least a part of the first  
15 baffle first side and at least a part of the transducer.
